

Lead Gen AI

AI-powered B2B lead generation & sales-performance platform

Prepared for: Leadership review | **Focus market:** Industrial automation, GCC (Saudi Arabia, UAE, Qatar, Kuwait, Bahrain, Oman)

Status: Deployed for team testing (Render) | **Access:** <https://lead-gen-ai-5cnv.onrender.com>

1. What it is

Lead Gen AI is an end-to-end system that finds industrial-automation decision-makers in the Gulf, enriches their contact and company data, scores each lead against our ideal-customer profile with AI, and gives a sales team the tools to work those leads and be measured on effort and results. It combines a data pipeline, an executive analytics layer, and a full sales-operations workflow in one web app.

2. What is live vs. planned

Capability	Status
Lead collection from Apollo (with filter rotation)	Live
Contact & company enrichment	Live
AI lead scoring (Groq / LLaMA 3.3) + rule-based fallback	Live
Analytics, explainability & audit	Live
Sales team: roles, assignment, activity tracking, leaderboard	Live
Email outreach (Brevo) — built, needs key to activate	Phase 2
Reply classification & Google Ads retargeting	Phase 2

3. Core lead pipeline

Leads move through clear stages: **Collect** → **Enrich** → **Score** → **Qualified**. The pipeline is built for quality and cost-discipline:

- **Apollo sourcing** with a two-step search-then-match flow, targeting the right titles, GCC locations, and company sizes.
- **Filter rotation engine** — the search is split into 18 profiles (each location × company-size band) and each collection run automatically rotates to the next, so we keep surfacing new leads instead of re-pulling the same ones.
- **Accuracy filters** — industry, seniority, and 100-per-page fetching for higher relevance and efficiency.
- **3-layer de-duplication** (Apollo ID → domain+name → LinkedIn) so no lead is counted or paid for twice.
- **Contact gating** — leads without an email or phone never advance, keeping the working list actionable.

- **AI scoring** on Groq's free tier, with a rule-based fallback if the AI is unavailable — every lead gets an ICP score, intent level, and offering match.

4. Sales-team operations

The platform turns a lead list into a managed, measurable sales operation:

- **Roles & teams** — Admin, Manager, Agent, Viewer. Each manager owns a team of agents.
- **Lead assignment** — managers assign leads to their agents; agents see only their own book of business.
- **Activity tracking** — agents log calls (with outcome/notes), emails, replies, and deals won/lost with value. Everything is attributed and time-stamped.
- **Leaderboard** — a weighted, points-based ranking (deal, revenue, reply, call, email) with a gold/silver/bronze podium and per-agent breakdowns. Managers can tune the point weights.
- **Effort + outcome visibility** — see who is calling, emailing, and closing, and the conversion from assigned leads to deals.

5. Analytics & intelligence

- **Business-outcome dashboard** — weighted pipeline value, total pipeline value, cost per qualified lead, and contactable rate, with adjustable deal-size and win-rate assumptions.
- **Conversion funnel** computed live from real data, with stage-to-stage rates.
- **Market intelligence** — breakdowns by country, industry, and company size, a score-distribution histogram, and a highest-scoring-companies leaderboard.
- **"Why this lead?" explainability** — every AI score is broken into transparent factors (title, industry, region, size, contactability) plus the model's reasoning, so the score is trusted, not a black box.
- **Lead 360 view** — full profile, enrichment, activity history, and pipeline timeline for any lead.
- **One-click board-ready PDF export** of the pipeline summary.

6. Product & enterprise features

- **Audit trail** — every action (logins, scoring, imports, assignments, deals, role changes) is recorded with actor and time.
- **Role-based access control** enforced on every sensitive action.
- **Data hygiene** — messy source fields (cities in the country column, junk industry values) are normalized automatically for clean reporting.
- **Productivity** — global command palette (jump/search), saved filter views, bulk actions, CSV/Excel import & export, and toast notifications.
- **Security** — API keys kept out of source code in environment variables; passwords hashed.

7. Technology

Layer	Technology
Backend / API	Python, FastAPI
Database	SQLite (Postgres-ready)
Frontend	React + Tailwind CSS
Lead source	Apollo.io API
AI scoring	Groq — LLaMA 3.3 70B (free tier)
Email (Phase 2)	Brevo API
Deployment	Docker on Render

8. Deployment & access

The full application is packaged as a single Docker service (the API also serves the web app) and is deployed on **Render's free tier** for team testing. It is live at:

<https://lead-gen-ai-5cnv.onrender.com>

Website	https://lead-gen-ai-5cnv.onrender.com
Login (admin)	admin@company.com

Password

admin123

Please note: on the free tier the app sleeps after 15 minutes of inactivity, so the first visit may take up to a minute to load while it wakes. Test data resets to a clean baseline on restart — ideal for repeatable demos. For a persistent, always-on environment we would move to a small paid tier.

9. Snapshot & next steps

At the most recent local data snapshot the system held ~913 collected leads, ~263 enriched, and ~93 scored across the GCC. Immediate next steps: activate email outreach (Brevo key), continue expanding the lead database via filter rotation, and — when ready for sustained use — move to persistent hosting.

Lead Gen AI — internal product report. Generated for leadership review.
