

Email domain authentication — stemronic.com

Requested by: Jawad Ahmed · **Action needed by:** GoDaddy account admin · **Domain:** stemronic.com

What this is for. Our new Lead-Gen platform sends outbound email through Brevo (our email service). For those emails to be sent from **@stemronic.com** — and to land in inboxes instead of spam — Brevo needs us to prove we own the domain by adding a few DNS records in GoDaddy. This is a standard, safe, additive change.

IMPORTANT — THIS DOES NOT TOUCH EXISTING MAIL

These are **new records only**. We are **not** changing or deleting any MX records, so your existing @stemronic.com mailboxes and the website are completely unaffected. Please only **add** the records below.

Records to add in GoDaddy

Add each record below **exactly** as written — copy the Value strings character-for-character. Leave TTL at the default (1 hour). **The DMARC record is already in place, so no action is needed on that one.**

RECORD	TYPE	NAME / HOST	VALUE (ENTER EXACTLY)	TTL
AUTHENTICATION — REQUIRED (lets us send as @stemronic.com)				
Brevo code (domain ownership)	TXT	@ (or leave blank)	brevo-code: 1c196fc5cd16dbc2da03b6248ef037c5	1 Hour
DKIM 1	CNAME	brevo1._domainkey	b1.stemronic-com.dkim.brevo.com	1 Hour
DKIM 2	CNAME	brevo2._domainkey	b2.stemronic-com.dkim.brevo.com	1 Hour
DMARC	TXT	_dmarc	Already configured — no action	—
BRANDING — OPTIONAL BUT RECOMMENDED (tracking links/images use stemronic.com)				
Branded record	CNAME	mail	mail-stemronic-com.brand.brevo.send.com	1 Hour
Redirection record	CNAME	r.mail	mail-stemronic-com.r.brand.brevo.send.com	1 Hour
Image redirection record	CNAME	img.mail	mail-stemronic-com.img.brand.brevo.send.com	1 Hour

Add the three **authentication** records first — they're what allow email to be sent as @stemronic.com. The three **branding** records are optional; they make click-tracking links and open-tracking images show stemronic.com instead of a Brevo address (nicer, and slightly better deliverability). Add them in the same pass if convenient.

How to add them in GoDaddy

1. Sign in to GoDaddy → **My Products** → find **stemronic.com** → click **DNS** (or "Manage DNS").
2. Under **Records**, click **Add New Record**.
3. Choose the **Type** (TXT or CNAME), enter the **Name/Host**, paste the **Value**, leave **TTL** at 1 Hour, and **Save**.
4. Repeat for each record in the table (six in total; DMARC is already done).

GODADDY TIP — THE NAME FIELD

In the **Name/Host** field, type only the part shown (e.g. brevo1._domainkey, _dmarc, or @ for the root). GoDaddy automatically adds .stemronic.com — do **not** type the full domain yourself.

After the records are added

- Please reply to let Jawad know they're in — he'll click **Authenticate / Verify** in Brevo.
- DNS changes usually take **15 minutes to a couple of hours** to take effect (occasionally up to 48 hours).
- Once verified, the platform will send email as **Stemronic AI <info@stemronic.com>** with proper SPF/DKIM/DMARC — good deliverability, no spoofing.

SUMMARY — WHAT YOU'RE APPROVING

Add up to **6 new DNS records** to stemronic.com in GoDaddy (DMARC is already in place). The **3 authentication records** let our platform send email as @stemronic.com; the **3 branding records** are optional polish. No existing records are modified — no impact to current email or the website.
